## Dates and Times

# Packages for this section

```
library(tidyverse)
# library(lubridate)
```

lubridate is the package that handles dates and times, but is now part of the tidyverse, so no need to load separately.

Dates and Times 2 / 28

### Dates

• Dates represented on computers as "days since an origin", typically Jan 1, 1970, with a negative date being before the origin:

```
mydates <- c("1970-01-01", "2007-09-04", "1931-08-05")
(somedates <- tibble(text = mydates) %>%
    mutate(
    d = as.Date(text),
    numbers = as.numeric(d)
))
```

```
# A tibble: 3 x 3

text d numbers

<chr> <date> <dbl>
1 1970-01-01 1970-01-01 0
2 2007-09-04 2007-09-04 13760
3 1931-08-05 1931-08-05 -14029
```

# Doing arithmetic with dates

• Dates are "actually" numbers, so can add and subtract (difference is 2007 date in d minus others):

```
somedates %>% mutate(plus30 = d + 30, diffs = d[2] - d)
```

```
# A tibble: 3 x 5

text d numbers plus30 diffs

<chr> <date> <dbl> <date> <drtn>

1 1970-01-01 1970-01-01 0 1970-01-31 13760 days

2 2007-09-04 2007-09-04 13760 2007-10-04 0 days

3 1931-08-05 1931-08-05 -14029 1931-09-04 27789 days
```

Dates and Times 4 / 28

## Reading in dates from a file

• read\_csv and the others can guess that you have dates, if you format them as year-month-day, like column 1 of this .csv:

```
date, status, dunno
2011-08-03, hello, August 3 2011
2011-11-15, still here, November 15 2011
2012-02-01, goodbye, February 1 2012
```

Then read them in:

```
my_url <- "http://ritsokiguess.site/datafiles/mydates.csv"
ddd <- read_csv(my_url)</pre>
```

• read\_csv guessed that the 1st column is dates, but not 3rd.

Dates and Times 5 / 28

### The data as read in

#### ddd

Dates and Times 6 / 28

### Dates in other formats

- Preceding shows that dates should be stored as text in format yyyy-mm-dd (ISO standard).
- To deal with dates in other formats, use package lubridate and convert. For example, dates in US format with month first:

```
tibble(usdates = c("05/27/2012", "01/03/2016", "12/31/2015"))
mutate(iso = mdy(usdates))
```

```
usdates iso
<chr> <date>
1 05/27/2012 2012-05-27
2 01/03/2016 2016-01-03
3 12/31/2015 2015-12-31
```

# A tibble:  $3 \times 2$ 

Dates and Times 7 / 28

## Trying to read these as UK dates

```
tibble(usdates = c("05/27/2012", "01/03/2016", "12/31/2015"))
  mutate(uk = dmy(usdates))
```

```
# A tibble: 3 x 2
usdates uk
<chr> <date>
1 05/27/2012 NA
2 01/03/2016 2016-03-01
3 12/31/2015 NA
```

• For UK-format dates with month second, one of these dates is legit (but wrong), but the other two make no sense.

Dates and Times 8 / 28

### Our data frame's last column:

Back to this:

#### ddd

Month, day, year in that order.

### so interpret as such

```
(ddd %>% mutate(date2 = mdy(dunno)) -> d4)
```

```
# A tibble: 3 x 4
 date
                     dunno
                                     date2
        status
 <date> <chr>
                     <chr>
                                    <date>
1 2011-08-03 hello
                     August 3 2011 2011-08-03
2 2011-11-15 still here November 15 2011 2011-11-15
                     February 1 2012 2012-02-01
3 2012-02-01 goodbye
```

10 / 28

## Are they really the same?

Column date2 was correctly converted from column dunno:

```
d4 %>% mutate(equal = identical(date, date2))
```

```
# A tibble: 3 x 5
date status dunno date2 equal
<date> <chr> <chr> < 2011-08-03 hello August 3 2011 2011-08-03 TRUE
2 2011-11-15 still here November 15 2011 2011-11-15 TRUE
3 2012-02-01 goodbye February 1 2012 2012-02-01 TRUE
```

• The two columns of dates are all the same.

Dates and Times 11/28

# Making dates from pieces

### Starting from this file:

```
year month day
1970 1 1
2007 9 4
1940 4 15
```

```
my_url <- "http://ritsokiguess.site/datafiles/pieces.txt"
dates0 <- read_delim(my_url, " ")</pre>
```

# Making some dates

#### dates0

```
# A tibble: 3 x 3
    year month day
    <dbl> <dbl> 1 1970 1 1
2 2007 9 4
3 1940 4 15
```

```
dates0 %>%
  unite(dates, day, month, year) %>%
  mutate(d = dmy(dates)) -> newdates
```

### The results

#### newdates

```
# A tibble: 3 x 2
 dates d
 <chr> <date>
1 1 1 1970 1970-01-01
2 4_9_2007 2007-09-04
3 15 4 1940 1940-04-15
```

- unite glues things together with an underscore between them (if you don't specify anything else). Syntax: first thing is new column to be created, other columns are what to make it out of.
- unite makes the original variable columns year, month, day disappear.
- The column dates is text, while d is a real date.

14 / 28

# Extracting information from dates

```
newdates %>%
mutate(
   mon = month(d),
   day = day(d),
   weekday = wday(d, label = TRUE)
)
```

```
# A tibble: 3 x 5
dates d mon day weekday
<chr> <date> <dbl> <int> <ord>
1 1_1_1970 1970-01-01 1 1 Thu
2 4_9_2007 2007-09-04 9 4 Tue
3 15_4_1940 1940-04-15 4 15 Mon
```

15/28

### Dates and times

 Standard format for times is to put the time after the date, hours, minutes, seconds:

```
(dd <- tibble(text = c(
  "1970-01-01 07:50:01", "2007-09-04 15:30:00",
  "1940-04-15 06:45:10", "2016-02-10 12:26:40"
)))</pre>
```

```
text

<chr>
1 1970-01-01 07:50:01

2 2007-09-04 15:30:00

3 1940-04-15 06:45:10

4 2016-02-10 12:26:40
```

# A tibble: 4 x 1

## Converting text to date-times:

• Then get from this text using ymd\_hms:

```
dd %>% mutate(dt = ymd_hms(text)) %>% pull(dt)
```

```
[1] "1970-01-01 07:50:01 UTC" "2007-09-04 15:30:00 UTC" [3] "1940-04-15 06:45:10 UTC" "2016-02-10 12:26:40 UTC"
```

Dates and Times 17 / 28

### **Timezones**

 Default timezone is "Universal Coordinated Time". Change it via tz= and the name of a timezone:

```
dd %>%
 mutate(dt = ymd hms(text, tz = "America/Toronto")) -> dd
dd %>% mutate(zone = tz(dt))
# A tibble: 4 x 3
                      dt
  text
                                           zone
  <chr>>
                      <dttm>
                                           <chr>>
1 1970-01-01 07:50:01 1970-01-01 07:50:01 America/Toronto
2 2007-09-04 15:30:00 2007-09-04 15:30:00 America/Toronto
3 1940-04-15 06:45:10 1940-04-15 06:45:10 America/Toronto
4 2016-02-10 12:26:40 2016-02-10 12:26:40 America/Toronto
```

Dates and Times 18 / 28

## Finding a timezone name

• Use OlsonNames(). Some of them:

```
sample(OlsonNames(), 10)
```

```
[1] "Etc/GMT-5"
```

- [3] "MST7MDT"
- [5] "America/Marigot"
- [7] "America/Rainy\_River"
- [9] "Pacific/Nauru"

```
"America/Thule"
```

- "America/Lower\_Princes"
- "Pacific/Tahiti"
- "Atlantic/Reykjavik"
- "America/Boa\_Vista"

Dates and Times 19 / 28

### Extracting time parts

• As you would expect:

```
dd %>%
  select(-text) %>%
  mutate(
    h = hour(dt), sec = second(dt),
    min = minute(dt), zone = tz(dt)
)
```

```
# A tibble: 4 \times 5
  dt.
                                    min zone
                                sec
  \langle dt.t.m \rangle
                       <int> <dbl> <int> <chr>
1 1970-01-01 07:50:01
                                  1
                                       50 America/Toronto
                          15
2 2007-09-04 15:30:00
                                  0
                                       30 America/Toronto
3 1940-04-15 06:45:10
                          6
                                 10
                                       45 America/Toronto
4 2016-02-10 12:26:40
                           12
                                 40
                                       26 America/Toronto
```

Dates and Times 20 / 28

### Same times, but different time zone:

<dttm>

< dt.t.m>

1 1970-01-01 07:50:01 1970-01-01 22:50:01 2 2007-09-04 15:30:00 2007-09-05 05:30:00 3 1940-04-15 06:45:10 1940-04-15 21:45:10 4 2016-02-10 12:26:40 2016-02-11 04:26:40

### In more detail

```
dd %>%
  mutate(oz = with_tz(dt, "Australia/Sydney")) %>%
  pull(oz)
```

```
[1] "1970-01-01 22:50:01 AEST" "2007-09-05 05:30:00 AEST" [3] "1940-04-15 21:45:10 AEST" "2016-02-11 04:26:40 AEDT"
```

"Australian Eastern Time", Standard or Daylight. Note when the Australian summer is.

Dates and Times 22 / 28

## How long between date-times?

 We may need to calculate the time between two events. For example, these are the dates and times that some patients were admitted to and discharged from a hospital:

```
admit,discharge

1981-12-10 22:00:00,1982-01-03 14:00:00

2014-03-07 14:00:00,2014-03-08 09:30:00

2016-08-31 21:00:00,2016-09-02 17:00:00
```

Dates and Times 23 / 28

## Do they get read in as date-times?

• These ought to get read in and converted to date-times:

```
my url <- "http://ritsokiguess.site/datafiles/hospital.csv"
stays <- read_csv(my_url)</pre>
stays
```

```
discharge
  \langle dt.t.m \rangle
                           \langle dt.t.m \rangle
1 1981-12-10 22:00:00 1982-01-03 14:00:00
2 2014-03-07 14:00:00 2014-03-08 09:30:00
3 2016-08-31 21:00:00 2016-09-02 17:00:00
```

and so it proves.

# A tibble:  $3 \times 2$ 

admit

## Subtracting the date-times

• In the obvious way, this gets us an answer:

```
stays %>% mutate(stay = discharge - admit)
```

• Number of hours; hard to interpret.

Dates and Times 25 / 28

## Days

• Fractional number of days would be better:

```
stays %>%
  mutate(
    stay_days = as.period(admit %--% discharge) / days(1))
```

Dates and Times 26 / 28

# Completed days

• Pull out with day() etc, as for a date-time:

```
stays %>%
  mutate(
    stay = as.period(admit %--% discharge),
    stay_days = day(stay),
    stay_hours = hour(stay)
    ) %>%
  select(starts_with("stay"))
```

### Comments

- Date-times are stored internally as seconds-since-something, so that subtracting two of them will give, internally, a number of seconds.
- Just subtracting the date-times is displayed as a time (in units that R chooses for us).
- Convert to fractional times via a "period", then divide by days (1), months(1) etc.
- These ideas useful for calculating time from a start point until an event happens (in this case, a patient being discharged from hospital).

28 / 28
